5G IN CONTENT PRODUCTION

Gathers Members and the industry to identify requirements in content production that need to be met in the 5G context

5G is a new broadband technology that will enable new services for consumers and business users. It is expected to provide super-fast, low latency and highly reliable wireless connections, which may allow broadcasters to produce content in a more efficient way and improve their offering to viewers and listeners.

Broadcasters hope that 5G can be used to improve technical and operational efficiency, increase flexibility, and reduce production cost. 5G is also hoped to enable new production workflows, in particular in news gathering, remote production, coverage of live events, and user engagement.

For these opportunities to materialize it is necessary to identify specific technical and other requirements in content production that need to be met in the 5G context.

5G FOR PROFESSIONAL MEDIA PRODUCTION AND CONTRIBUTION

Tech Report 056

TECHNICAL REPORTS 07 Oct 2020

The scope of this document is to explore the possibilities provided by 5G rather than other forms of wireless solution. To this end, several challenges need to be addressed and these can be broken down into four key areas: standardisation, technology availability, regulation, and business models

[OPEN FILE \(PDF, 1.2 MB\)](#)

5G represents an opportunity and challenges for the content creation industry. 5G offers much in terms of bandwidth, reduced latency, timing and quality of service. It is also expected that standardised 5G-based solutions would bring down the costs and increase the flexibility of production.

But the 5G roll-out is a gradual evolution and will take time to achieve the capabilities promised by the marketing hype, if it ever does. The media industry is engaging well with the standards bodies and regulatory bodies. Innovative ways of
